

Here is another neat trick...

$$\int \sec x dx =$$

Hint 1...here is what the answer will look like with this trick

$$\ln |\sec x + \tan x| + C.$$

Hint 2...It is always legal to multiply by 1

$$\int \sec x dx \left(\frac{\sec x + \tan x}{\sec x + \tan x} \right)$$

$$\int \frac{\sec^2 x + \sec x \tan x}{\tan x + \sec x} dx$$

$$= \ln |\tan x + \sec x| + C$$

$$\begin{aligned} & d(\ln |\sec x + \tan x|) \\ &= \frac{1 \cdot (\sec x \tan x + \sec^2 x)}{\sec x + \tan x} \end{aligned}$$

$$\int \csc x \, dx \quad \left(\frac{\csc x + \cot x}{\csc x + \cot x} \right)$$

$$= - \int \frac{\csc^2 x + \csc x \cot x}{\csc x + \cot x} \, dx$$

$$= - \ln |\csc x + \cot x| + C$$

Warm Up

Evaluate each of the following:

$$\int \frac{1}{(16 - x^2)^{\frac{3}{2}}} dx \quad (\text{UNB: 2005})$$

$$\int \frac{\sqrt{2 - x^2}}{x} dx \quad (\text{UNB: 2004})$$

$$\int (\csc^2 t \cot^2 t) dt \quad (\text{UNB: 2004})$$

$$\int \frac{\ln(\ln x)}{x} dx \quad (\text{StFX: 2005})$$

$$\frac{2}{\sqrt{2}} \int \frac{\cos^2 \theta}{\sin \theta} d\theta$$

$$\frac{2}{\sqrt{2}} \int \frac{1 - \sin^2 \theta}{\sin \theta} d\theta$$

$$\frac{2}{\sqrt{2}} \int (\csc \theta - \sin \theta) d\theta$$

$$\frac{2}{\sqrt{2}} \left[\int \csc \theta d\theta - \int \sin \theta d\theta \right]$$

$$\frac{2}{\sqrt{2}} \left[\int \csc \theta d\theta \left(\frac{\csc \theta + \cot \theta}{\csc \theta + \cot \theta} \right) + \cos \theta \right] + C$$

$$\frac{2}{\sqrt{2}} \left[- \int \frac{\csc^2 \theta + \csc \theta \cot \theta}{\cot \theta + \csc \theta} d\theta + \cos \theta \right] + C$$

$$\frac{2}{\sqrt{2}} \left(-\ln |\csc \theta + \cot \theta| + \cos \theta \right) + C$$

Integration using Partial Fractions

Simplify: $\frac{3}{x-5} + \frac{2}{x+4}$

We want to reverse the process of finding a common denominator...

Express as partial fractions: $\frac{5x+2}{x^2-x-20}$

1. Factor the denominator: $\frac{5x+2}{(x-5)(x+4)}$

2. Separate into partial fractions:

$$\frac{A}{x-5} + \frac{B}{x+4} = \frac{5x+2}{x^2-x-20}$$

3. Find common denominator and solve for A and B :

Now let's evaluate the following integral...

$$\int \frac{(5x+2)dx}{x^2-x-20}$$

Here is another example...

$$\int \frac{xdx}{x^2-3x+2}$$

Some special situations involving partial fractions...

Note 1: ✓

- If the degree of the numerator is the same as that of the denominator, or higher, we would have to take the preliminary step of first performing a long division.

$$\text{Ex. } \frac{2x^3 - 11x^2 - 2x + 2}{2x^2 + x - 1}$$

$$2x^2 + x + 1 \overline{) 2x^3 - 11x^2 - 2x + 2} = (x - 6) + \frac{5x - 4}{(x+1)(2x-1)}$$

Note 2: ✓

- If the denominator has more than two linear factors, we must include a term corresponding to each factor.

$$\text{Ex. } \frac{x+6}{x(x-3)(4x+5)} = \frac{A}{x} + \frac{B}{x-3} + \frac{C}{4x+5}$$

$$\frac{1}{a^2} + \frac{1}{a} = \frac{3}{x+2} - \frac{4}{(x+2)^2} + \frac{6}{x} = \frac{\quad}{x(x+2)^2}$$

Note 3: ✓

- If a linear factor is repeated, we need to include extra terms in the partial fraction expression.

$$\text{Ex. } \frac{x}{(x+3)^2(x-2)} = \frac{A}{x+3} + \frac{B}{(x+3)^2} + \frac{C}{x-2}$$

Note 4:

- When we factor the denominator as far as possible, it may happen that we end up with an irreducible quadratic factor of the form $ax^2 + bx + c$, where the discriminant is negative. Then the corresponding partial fraction is of the form...

$$\frac{Ax+B}{x^2+2} \quad \frac{Ax+B}{ax^2+bx+c} \quad \frac{Ax^2+Bx+C}{ax^2+bx^2+c(x+d)}$$

where A and B are constants to be determined. This term can be integrated by completing the square and by using the integration formula...

$$\int \frac{dx}{x^2 + a^2} = \frac{1}{a} \tan^{-1} \left(\frac{x}{a} \right) + C \quad (\text{or a trig. substitution})$$

$$2x^2 + x - 1 \overline{) 2x^3 - 11x^2 - 2x + 2} = (x - 6) + \frac{5x - 4}{(x+1)(2x-1)}$$

$$\begin{array}{r} 2x^2 + x - 1 \quad \underline{-12x^2 - x + 2} \\ 2x^2 + 2x - x - 1 \quad \underline{-12x^2 - 6x + 6} \\ 2x(x+1) - 1(x+1) \quad \underline{5x - 4} \\ (2x-1)(x+1) \end{array}$$

Ex. $\int \frac{2x^3 - 11x^2 - 2x + 2}{2x^2 + x - 1} dx$

$$\int (x-6) + \frac{5x-4}{(2x-1)(x+1)} dx$$

$$\int (x-6) dx + \int \frac{5x-4}{(2x-1)(x+1)} dx$$

Partial Fractions

$$\frac{A}{2x-1} + \frac{B}{x+1} = \frac{5x-4}{(2x-1)(x+1)}$$

$$A(x+1) + B(2x-1) = 5x-4$$

$$Ax + A + 2Bx - B = 5x - 4$$

$$A + 2B = 5 \quad A - B = -4$$

$$A - B = -4$$

$$\begin{array}{l} 3B = 9 \\ B = 3 \end{array}$$

$$\begin{array}{l} A - 3 = -4 \\ A = -1 \end{array}$$

$$\int (x-6) dx + \int \frac{-1}{2x-1} dx + \int \frac{3}{x+1} dx$$

$$= \frac{x^2}{2} - 6x - \frac{1}{2} \ln|2x-1| + 3 \ln|x+1| + C$$

$$\text{Ex. } \frac{x+6}{x(x-3)(4x+5)} = \frac{A}{x} + \frac{B}{x-3} + \frac{C}{4x+5}$$

$$A(x-3)(4x+5) + B(x)(4x+5) + C(x)(x-3) = x+6$$

$$A(4x^2 - 7x - 15) + B(4x^2 + 5x) + C(x^2 - 3x) = x + 6$$

$$4Ax^2 - 7Ax - 15A + 4Bx^2 + 5Bx + Cx^2 - 3Cx = x + 6$$

$$\textcircled{1} 4A + 4B + C = 0$$

$$\textcircled{2} -7A + 5B - 3C = 1$$

$$\textcircled{3} -15A = 6$$

$$-\frac{8}{5} + 4B + C = 0$$

$$\frac{14}{5} + 5B - 3C = 1$$

$$A = \frac{-6}{15} = -\frac{2}{5}$$

$$\begin{pmatrix} 4B + C = \frac{8}{5} \end{pmatrix}$$

$$5B - 3C = -\frac{9}{5}$$

$$12B + 3C = \frac{24}{5}$$

$$5B - 3C = -\frac{9}{5}$$

$$17B = 3$$

$$B = \frac{3}{17}$$

$$\longrightarrow 4\left(\frac{3}{17}\right) + C = \frac{8}{5}$$

$$C = \frac{8}{5} - \frac{12}{17}$$

$$C = \frac{76}{85}$$

Examples...

$$(a) \int \frac{x-1}{x(x^2+2x+1)} dx$$

$$(b) \int \frac{2x^2+x+16}{(x-2)(x^2+9)} dx$$

$$\int \frac{x-1}{x(x+1)^2} dx$$

$$\frac{A}{x} + \frac{B}{x+1} + \frac{C}{(x+1)^2} = \frac{x-1}{x(x+1)^2}$$

$$A(x+1)^2 + Bx(x+1) + Cx = x-1$$

$$A(x^2+2x+1) + Bx^2+Bx+Cx = x-1$$

$$Ax^2+2Ax+A+Bx^2+Bx+Cx = x-1$$

$$A+B=0 \quad 2A+B+C=1 \quad A=-1$$

$$-1+B=0 \quad 2(-1)+1+C=1$$

$$B=1 \quad C=2$$

$$-\int \frac{1}{x} dx + \int \frac{dx}{x+1} + 2 \int (x+1)^{-2} dx$$

$$-\ln|x| + \ln|x+1| - 2(x+1)^{-1} + C$$
