

using the combined method. (7)

2. A hot air balloon flew 12 h at an average speed of 210 km/h. How far did it travel? (6)

3. A race car accelerates at  $5.0 \text{ m/s}^2$  [W]. If its initial velocity is  $56 \text{ m/s}$  [W], how far has it travelled after  $8.0 \text{ s}$ ? (6)

4. A truck is travelling at  $22 \text{ m/s}$  when the driver notices a speed limit sign for the town ahead. He slows down to a speed of  $14 \text{ m/s}$ . He travels a distance of  $125 \text{ m}$  while he is slowing down. How long did it take the truck driver to change his speed? (6)

$$\left. \begin{aligned} 1. \quad \vec{\Delta d}_1 &= -35\text{m} \\ \vec{\Delta d}_2 &= +67\text{m} \\ \vec{\Delta d}_R &=? \end{aligned} \right\} \textcircled{1}$$

$$\vec{\Delta d}_R = \vec{\Delta d}_{R1} + \vec{\Delta d}_{R2} \textcircled{1}$$

$$\vec{\Delta d}_R = -35\text{m} + 67\text{m} \textcircled{1}$$

$$\vec{\Delta d}_R = 32\text{m} \textcircled{1}$$

The resultant displacement of the shopper was  $32\text{m}$ , East  $\textcircled{1}$

$$\left. \begin{aligned} 2. \quad v_{ave} &= 210 \frac{\text{km}}{\text{h}} \\ t &= 12\text{h} \\ d &=? \end{aligned} \right\} \textcircled{1}$$

$$v_{ave} = \frac{d}{t} \textcircled{1}$$

$$d = v_{ave} t \textcircled{1}$$

$$d = 210 \times 12\text{h} \textcircled{1}$$

$$d = 2520\text{km} \textcircled{1}$$

$$d = 2.5 \times 10^3 \text{km} \textcircled{1}$$

The hot air balloon  $\textcircled{1}$   
travelled  $2.5 \times 10^3 \text{km}$ .  $\textcircled{6}$

$$\left. \begin{aligned} 3. \quad \vec{a} &= -5.0 \text{m/s}^2 \\ \vec{v}_i &= -56 \text{m/s} \\ t &= 8.0\text{s} \\ \vec{d} &=? \end{aligned} \right\} \textcircled{1}$$

$$\vec{d} = \vec{v}_i t + \frac{1}{2} \vec{a} t^2 \textcircled{1}$$

$$\vec{d} = (-56 \text{m/s})(8.0\text{s}) + \frac{1}{2}(-5.0 \frac{\text{m}}{\text{s}^2})(8.0\text{s})^2 \textcircled{1}$$

$$\vec{d} = 608\text{m}$$

$$\vec{d} = 6.1 \times 10^2 \text{m} \textcircled{1}$$

The race car traveled  
 $6.1 \times 10^2 \text{m}$ .  $\textcircled{1}$

$$\left. \begin{aligned} 4. \quad \vec{v}_i &= 22 \text{m/s} \\ \vec{v}_f &= 14 \text{m/s} \\ \vec{d} &= 125 \text{m} \\ t &=? \end{aligned} \right\}$$

$$\vec{d} = \frac{1}{2}(\vec{v}_i + \vec{v}_f)t$$

$$\frac{2\vec{d}}{\vec{v}_i + \vec{v}_f} = t$$

$$t = \frac{2(125)}{(22 + 14)}$$

$$t = 6.9\text{s}$$

It took the driver  
 $6.9\text{s}$  to change his  
speed.
