

Environmental Problems Disrupting Natural Cycles by Humans

1. radioactive contamination
2. pollution of the ocean
3. depletion of fish stocks
4. use of fossil fuels
5. draining of underground aquifers
6. clearing of forests
7. use of fertilizers and pesticides

- * we will look further into #1 since we in NB rely on nuclear energy from...

Fukushima Accident 2011

(updated 2 April 2013)

- Following a major earthquake, a 15-metre tsunami disabled the power supply and cooling of three Fukushima Daiichi reactors, causing a nuclear accident on 11 March 2011.
- All three cores largely melted in the first three days.
- The accident was rated 7 on the INES scale, due to high radioactive releases in the first few days. Four reactors are written off - 2719 MWe net.
- After two weeks the three reactors (units 1-3) were stable with water addition but no proper heat sink for removal of decay heat from fuel. By July they were being cooled with recycled water from the new treatment plant. Reactor temperatures had fallen to below 80°C at the end of October, and official 'cold shutdown condition' was announced in mid December.
- Apart from cooling, the basic ongoing task was to prevent release of radioactive materials, particularly in contaminated water leaked from the three units.
- There have been no deaths or cases of radiation sickness from the nuclear accident, but over 100,000 people had to be evacuated from their homes to ensure this. Government nervousness delays their return.

EXERCISE:

Come up with 10 FACTS mentioned in this video.

FACTS from the video...

- earthquake followed by tsunami caused power failure in reactors 1 - 4.
- need 1 million gallons of water to 'cool' the reactors.
- radioactive water got into Pacific Ocean.
- hydrogen explosions occurred.
- radiation lasts a long time and affects many people worldwide.
- mutations occurred amongst babies.
- cancer became more frequent.

2) Chernobyl, Ukraine (April 1986)

Chernobyl Heart

 [Environment](#)  [74 Comments](#)

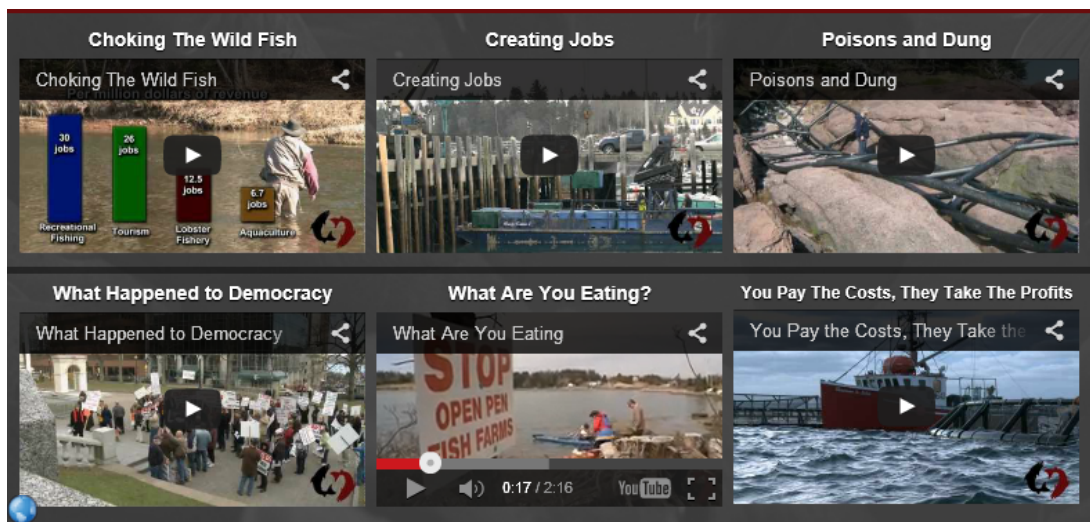

On April 26, 1986, the worst nuclear accident in history occurred when a reactor exploded at the Chernobyl nuclear power plant in Ukraine, releasing 90 times the radioactivity of the atomic bombs dropped on Hiroshima and Nagasaki. Sixteen years later, award-winning filmmaker Maryann De Leo took her camera to ground zero, following the devastating trail radiation leaves behind in hospitals, orphanages, mental asylums and evacuated villages. The Academy Award®-winning documentary short debuts immediately after the America Undercover special “Indian Point: Imagining the Unimaginable”.

The New Brunswick government is introducing a moratorium on hydraulic fracturing that the Premier says won't be lifted until five conditions are met.

Those conditions include a process to consult with First Nations, a plan for waste water disposal and credible information about the impacts fracking has on health, water and the environment, Brian Gallant said Thursday.
