UNIT 1: RATIONAL NUMBERS

**SECTION 3.4:
MULTIPLYING RATIONAL
NUMBERS**

M. MALTBY INGERSOLL
MATH 9

WHAT'S THE POINT OF TODAY'S LESSON?

We will continue working on the Math 9 Specific Curriculum Outcome (SCO) "Numbers 3" OR "N3" which states:

"Demonstrate an understanding of rational numbers by: comparing and ordering rational numbers; solving problems that involve arithmetic operations on rational numbers."

What does THAT mean???

SCO N3 means that we will compare and order (largest vs smallest), add, subtract, multiply and divide fractions and any numbers that can be written as fractions. For example, sometimes we will work with $\frac{1}{2}$ or 0.5. We have to know how to work with both.

HOMEWORK QUESTIONS???
(page 121, #1, #3, #4, #6, #8 & #9)

SECTION 3.4: MULTIPLYING RATIONAL NUMBERS

THE SIGN RULES FOR MULTIPLYING RATIONAL NUMBERS:

$$(+)\times(+)=+$$

$$(-)\times(-)=+$$

$$(+)\times(-)=-$$

$$(-)\times(+)=-$$

There are several ways to demonstrate multiplication:

$$\frac{1}{2} \times \frac{1}{3}$$

$$\left(\frac{1}{2}\right)\left(\frac{1}{3}\right)$$

$$\frac{1}{2}\left(\frac{1}{3}\right)$$

$$\frac{1}{2} \bullet \frac{1}{3}$$

MULTIPLYING RATIONAL NUMBERS IN FRACTION FORM:

To multiply fractions, simply multiply numerators then denominators. If there are more than two fractions, work from left to right. Reduce answers where necessary.

EXAMPLES:

$$1) \quad (-1.5)(-1.8) \\ = 2.7$$

$$2) \quad \left(\frac{3}{2}\right)\left(\frac{1}{5}\right) \\ = \frac{3}{10}$$

EXAMPLES:

$$\begin{aligned}
 3) & \quad \left(\frac{11}{7} \right) \left(\frac{-21}{44} \right) \\
 & \quad = \left(\frac{1}{1} \right) \left(\frac{-3}{4} \right) \\
 & \quad = \frac{-3}{4}
 \end{aligned}$$

Handwritten annotations: A red '1' is above the first fraction, a green '-3' is above the second fraction, a red '4' is to the right of the second fraction, and a blue arrow points from the second fraction to the final result.

$$\begin{aligned}
 4) & \quad \left(-2\frac{2}{3} \right) \left(-1\frac{3}{4} \right) \\
 & \quad = \left(\frac{-8}{3} \right) \left(\frac{-7}{4} \right) \\
 & \quad = \frac{14}{3} \\
 & \quad = 4\frac{2}{3}
 \end{aligned}$$

Handwritten annotations: A red '-2' is above the first fraction, a red '1' is to the right of the second fraction, and a red line is drawn through the second fraction.

EXAMPLES:

- 5) On February 5, 2008, the price of a share in CIBC changed by **-\$1.640**. A person owns 35 shares. By how much did those shares change in value that day?

$$\begin{aligned} & (35)(-1.640) \\ = & -57.40 \end{aligned}$$

The value of the shares decreased by **\$57.40** that day.

EXAMPLES:

- 6) Please note that fractions are more accurate than repeating or non-terminating, non-repeating decimals.

ex.: $\frac{2}{3}$ is more accurate than $0.\overline{6}$. Why?

$0.\overline{6}$ will end up getting rounded to 0.7 in a calculation which alters the accuracy of the calculation.

$$\frac{7}{10}$$

CONCEPT REINFORCEMENT:
