

Trigonometric Ratios

*** Must have calculator in DEGREE mode ***

Primary Trigonometric Ratios

$$\sin \theta = \frac{\text{opp}}{\text{hyp}}$$

$$\cos \theta = \frac{\text{adj}}{\text{hyp}}$$

$$\tan \theta = \frac{\text{opp}}{\text{adj}}$$

Memory Aid: "SOH CAH TOA"

EXAMPLE - Finding an unknown side SOH CAH TOA

adj x 44° hyp 12.8 cm

$$\cos 44^\circ = \frac{x}{12.8}$$

$$x = 12.8 \cos 44^\circ$$

$$x = 9.21 \text{ cm}$$

23° opp 8 hyp y

$$y \sin 23^\circ = \frac{8}{\sin 23^\circ}$$

swapped \rightarrow

$$y = \frac{8}{\sin 23^\circ}$$

EXAMPLE - Finding an unknown angle

adj 14.3 m opp 18.1 m θ

$$\tan^{-1} \tan \theta = \frac{18.1}{14.3}$$

$$\theta = 52^\circ$$

EXAMPLE - Solve the triangle (find ALL sides and angles)

adj 15 mm hyp 39 mm 67°

$$a^2 = 39^2 - 15^2$$

$$\sqrt{a} = \sqrt{296}$$

$$a = 36$$

$$\cos A = \frac{15}{39}$$

$$\angle A = 67^\circ$$

$$\angle B = 13^\circ$$

35° opp 10.25 adj 17.87

$$\tan 55^\circ = \frac{10.25}{14.64}$$

$$14.64 = b$$

$$\cos 55^\circ = \frac{10.25}{i}$$

$$i = \frac{10.25}{\cos 55^\circ}$$

$$i = 17.87$$

Applications of Right Angle Trigonometry

ANGLE OF ELEVATION/DEPRESSION

Angle of elevation - is the angle between the ground and the line of sight. (angle of inclination)

Always from the GROUND up

Angle of Depression - is the angle between the horizon and the line of sight.

Always outside the triangle

$$\angle \text{ of elev} = \angle \text{ of depression}$$

Example 1:

Two trees are 100m apart. From a point on midway between them, the angles of elevation to their tops are 8° and 13° . How much taller is one tree than the other?

① x

② $50 \tan 13^\circ = \frac{x}{50}$

$11.5 = x$

③ $50 \tan 8^\circ = \frac{y}{50}$

$7.0 = y$

③ Taller = $11.5 - 7 = 4.5 \text{ m}$

Example 2:

The 8th floor of an apartment building is 25m above the ground. From the 8th floor, the angle of elevation to the top of the other building is 50°. The angle of depression to the base of the taller building is 34°. Determine the height of the taller building.

$$\textcircled{1} \tan 34^\circ = \frac{25}{y}$$

$$y = \frac{25}{\tan 34^\circ}$$

$$y = 37.1$$

$$\textcircled{2} \tan 50^\circ = \frac{x}{37.1}$$

$$44.2 = x$$

$$\textcircled{3} h = 44.2 + 25$$

$$h = 69.2 \text{ m}$$
