

Find the missing sides and angles for the following triangles.

$$\cos \theta = \frac{\text{adj}}{\text{hyp}}$$

$$\cos Z = \frac{8}{12}$$

$$Z = \cos^{-1}(8/12)$$

$$Z = 48^\circ$$

$$x = 180 - 90 - 48$$

$$x = 42^\circ$$

$$a^2 = c^2 - b^2$$

$$y^2 = 12^2 - 8^2$$

$$= 144 - 64$$

$$= 80$$

$$y = \sqrt{80}$$

$$y = 8.9$$

$$Z = 180 - 90 - 30$$

$$Z = 60^\circ$$

$$\tan 30^\circ = \frac{8}{y}$$

$$y \tan 30 = \frac{8}{\tan 30}$$

$$y = 13.9$$

$$\sin \theta = \frac{\text{opp}}{\text{hyp}}$$

$$\sin 30^\circ = \frac{8}{x}$$

$$x \sin 30 = \frac{8}{\sin 30}$$

$$x = 16$$

Angle of depression - look down

Angle of elevation - look up

1. A television antenna casts a shadow that is 75.0m long. If the angle of elevation of the sun is 39° , calculate the height of the antenna.

$$\begin{aligned} \tan \theta &= \frac{\text{opp}}{\text{adj}} \\ \tan 39^\circ &= \frac{x}{75} \\ x &= 75 \tan 39^\circ \\ &= 60.7 \text{ m} \end{aligned}$$

From the top of a lighthouse, a hovercraft is sighted at an angle of depression of 47° . If the lighthouse is 42.0m high, how far is the vessel from the lighthouse?

$$\begin{aligned} \tan \theta &= \frac{\text{opp}}{\text{adj}} \\ \tan 47^\circ &= \frac{42.0}{x} \\ x &= \frac{42.0}{\tan 47^\circ} \\ &= 39.2 \text{ m} \end{aligned}$$
