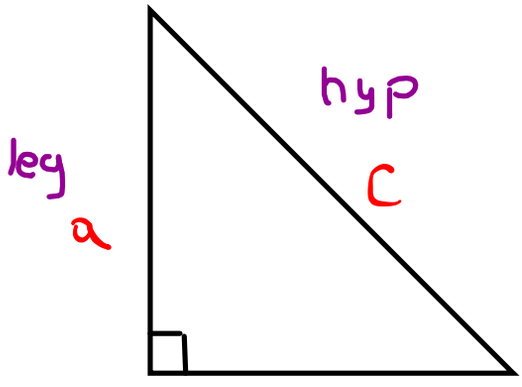
Curriculum Outcomes:

(SS1) Solve problems and justify the solution strategy using circle properties, including: the perpendicular from the centre of a circle to a chord bisects the chord; the measure of the central angle is equal to twice the measure of the inscribed angle subtended by the same arc; the inscribed angles subtended by the same arc are congruent; a tangent to a circle is perpendicular to the radius at the point of tangency.

Student Friendly:
How we can use the tangent properties to solve for unknown lengths. (Tangent properties go hand and hand with Pythagorean theorem)

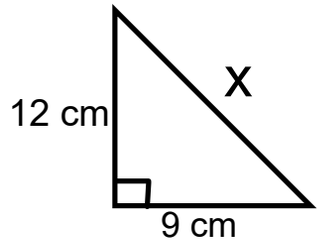
Pythagorean Theorem Review



$c^2 = a^2 + b^2$

$a^2 = c^2 - b^2$

1)



$c^2 = a^2 + b^2$

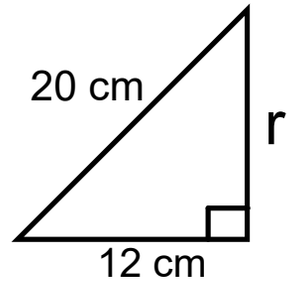
$c^2 = 12^2 + 9^2$

$c^2 = 144 + 81$

$\sqrt{c^2} = \sqrt{225}$

$c = 15$

2)



$a^2 = c^2 - b^2$

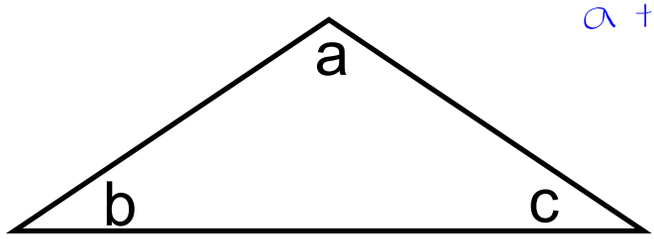
$a^2 = 20^2 - 12^2$

$a^2 = 400 - 144$

$\sqrt{a^2} = \sqrt{256}$

$a = 16$

Missing angles:



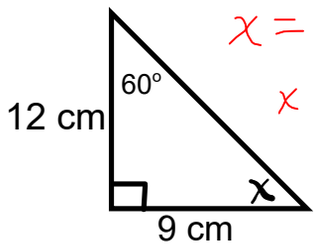
$a + b + c = 180^\circ$

$b = 180 - a - c$

$a = 180 - b - c$

$c = 180 - a - b$

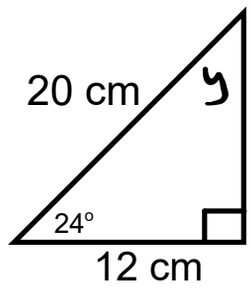
1)



$x = 180^\circ - 90 - 60$

$x = 30^\circ$

2)

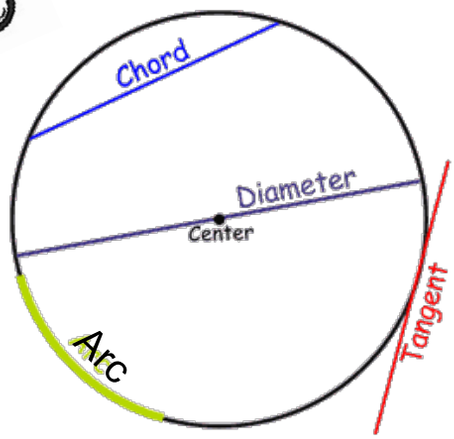


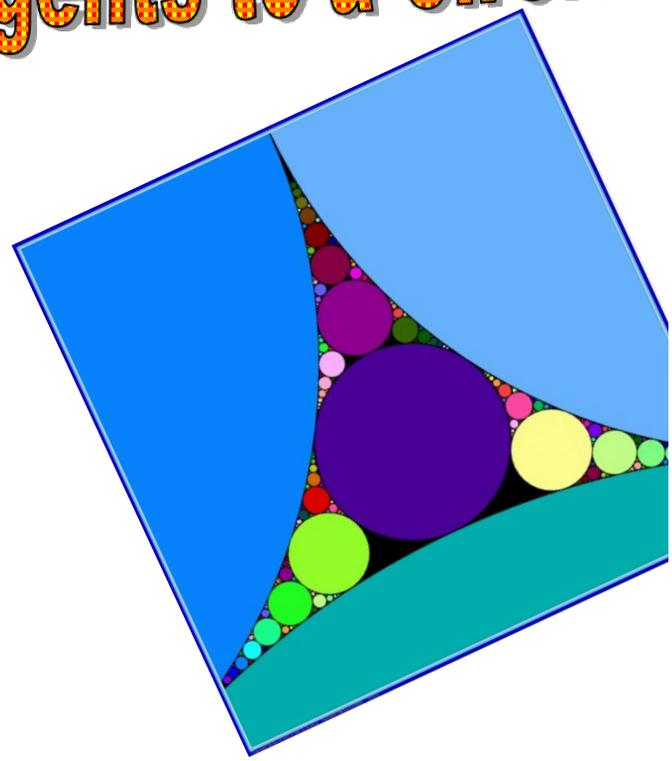
$y = 180 - 90 - 24^\circ$

$y = 66^\circ$

Section 8.1

Properties of Tangents to a Circle

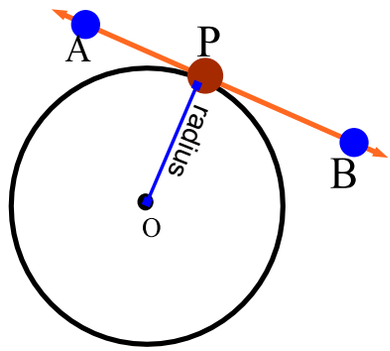




Tangent Properties

- **tangent -** a line that touches a circle/curve at only 1 point.
  - the point of contact is called the **point of tangency.**

ex:



Line AB is a tangent

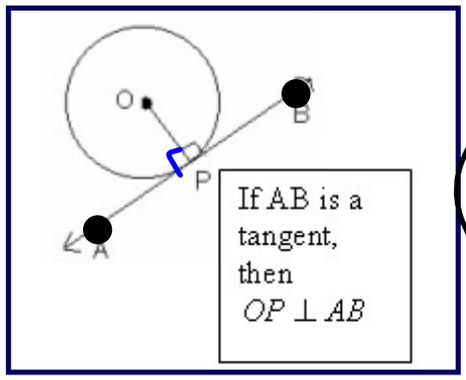
"P" is the **point of tangency**

Center is Denoted by "O"

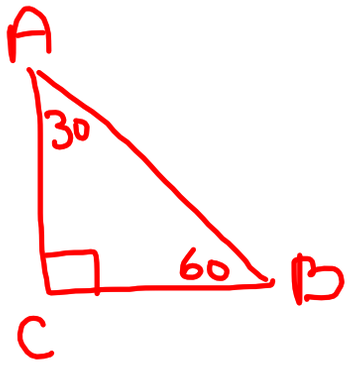
Tangent Property 1:

A tangent to a circle is perpendicular to the radius at the point of tangency. <APO = <BPO = 90° (Tang P)

(3)



"Join O to B and you have formed a right triangle. Thus, you can use the Pythagorean Theorem to find side lengths." (OR Angle sum of triangle to find missing angles)



$\angle CAB = 30^\circ$

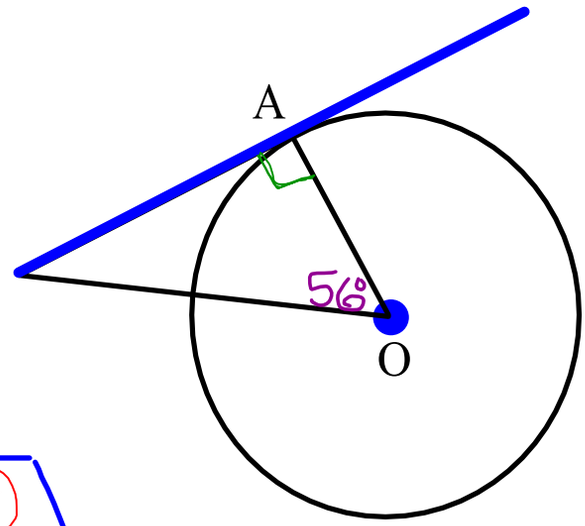
$\angle ABC = 60^\circ$

$\angle ACB = 90^\circ$

Determining the Measure of an Angle in a Triangle

1) Point O is the centre of a circle and AB is a Tangent to the circle. In ΔOAB, <AOB = 56°. Determine the measure of <OBA. Point A is the point of tangency.

(Show all Work)



∠AOB = 56° (given)

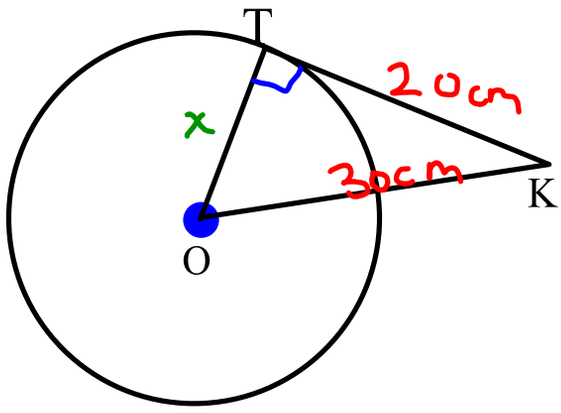
∠BAO = 90° (Tang P)

∠OBA = 180 − 90 − 56

∠OBA = 34° (SATT)

Using the Pythagorean Theorem in a Circle

2) Point O is the center of a circle and TK is a tangent to the circle. TK is 20cm and OK = 30cm. Determine the length of the radius OT. Give the answer to the nearest tenth. Point T is the point of tangency.



$\angle OTK = 90°$ (Tang P)

OT → radius

$a^2 = c^2 - b^2$

$a^2 = 30^2 - 20^2$

$a^2 = 900 - 400$

$a^2 = 500$

$a = 22.4$

Wrap Up to Tangents

$\angle$ ___ $= 90^\circ$ (Tang P)

Only two ways to solve Tangent Problems:

1) Angle sum of a triangle

$180^\circ - 90^\circ$ - given angle = unknown angle

2) Pythagorean Theorem

$c = \sqrt{a^2 + b^2}$ Hypotenuse

$a = \sqrt{c^2 - b^2}$ Leg

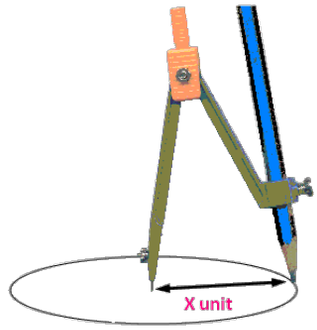
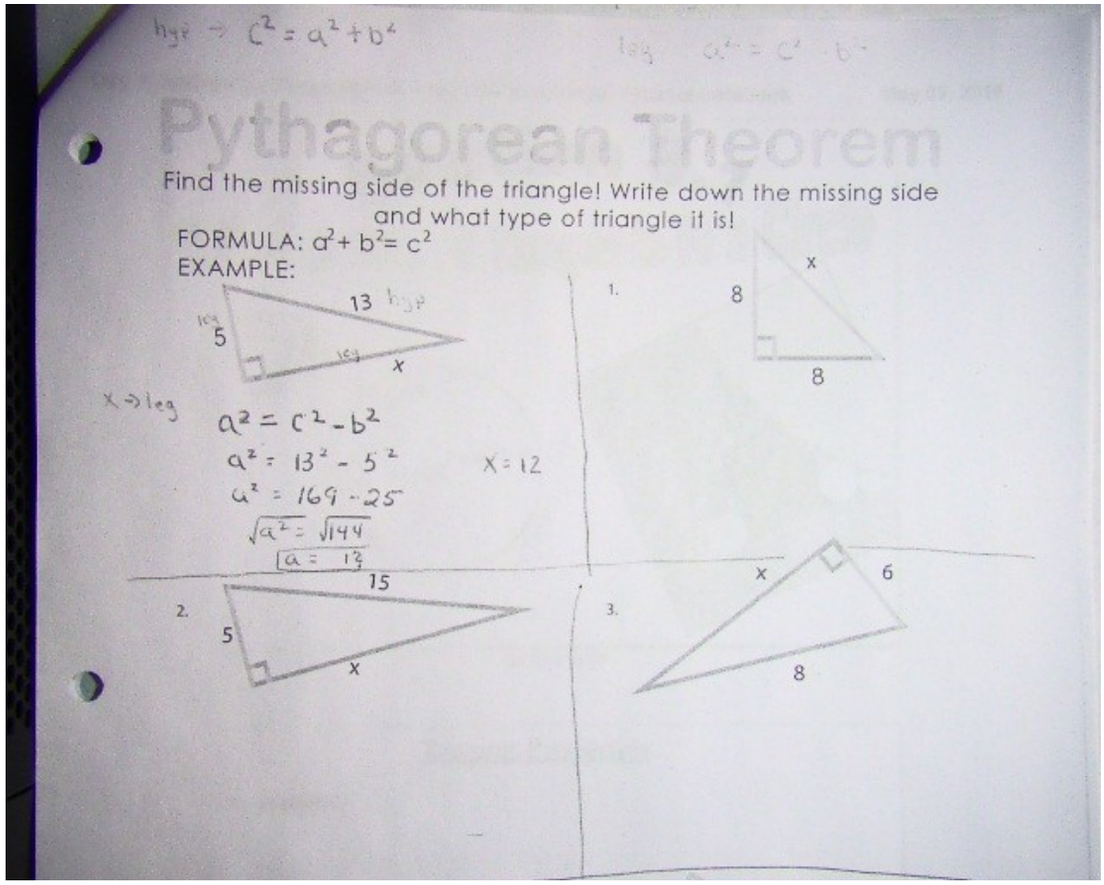
7ab sketch





hyp → $c^2 = a^2 + b^2$
Pythagorean Theorem
Find the missing side of the triangle! Write down the missing side and what type of triangle it is!
FORMULA: $a^2 + b^2 = c^2$
EXAMPLE:
13 hyp
leg 5
leg x
x → leg
$a^2 = c^2 - b^2$
$a^2 = 13^2 - 5^2$
$a^2 = 169 - 25$
$\sqrt{a^2} = \sqrt{144}$
$a = 12$
X = 12
