

System of Equations

Elimination using Addition

Consider the system

$$\begin{array}{r} x - 2y = 5 \quad \leftarrow \\ + \quad 2x + 2y = 7 \quad \leftarrow \\ \hline \end{array}$$

Elimination using Addition

Consider the system

$$\begin{array}{r} | x - 2y = 5 \\ + 2x + 2y = 7 \end{array}$$

touch
← Lets add both equations
← to each other

$$\begin{array}{r} 3x = 12 \\ \hline 3 \quad 3 \\ x = 4 \end{array}$$

Elimination using Addition

Consider the system

$$\begin{array}{r}
 x - 2y = 5 \\
 + 2x + 2y = 7 \\
 \hline
 3x \quad = 12
 \end{array}$$

← Lets add both equations
← to each other

solve for x

ANS: (4, y)

$$x = 4$$

Now solve for y (HOW???)

- sub the value of x into one of the equations and solve for y

$$x - 2y = 5$$

$$4 - 2y = 5$$

$$- 2y = 1$$

$$y = \frac{-1}{2}$$

intersection point (4, - 0.5)

Elimination using Addition

Same process as before
You can choose to eliminate either x or y

$$\begin{array}{r} x + 3y = 14 \\ \square \\ -x + 4y = 7 \\ \hline \end{array}$$

Who would you eliminate??

Elimination using Addition

$$\begin{array}{r} x + 3y = 14 \\ + \quad \boxed{-x} + 4y = 7 \end{array}$$

Add this time

Elimination using Addition

$$\begin{array}{r} x + 3y = 14 \\ -x + 4y = 7 \\ \hline 7y = 21 \end{array}$$

Add this time

$$y = 3$$

$$(x, 3)$$

solve for x

$$x + 3y = 14$$

$$x + 3(3) = 14$$

$$x + 9 = 14$$

$$x = 14 - 9$$

$$x = 5$$

Solve the system of equations

Example 1)

$$\begin{array}{r}
 2x + y = 5 \\
 + 3x - y = 15 \\
 \hline
 5x = 20 \\
 \hline
 x = 4
 \end{array}$$

$$x = 4$$

$$2(4) + y = 5$$

$$\begin{array}{r}
 8 + y = 5 \\
 -8 \quad \quad \quad -8 \\
 \hline
 y = -3
 \end{array}$$

Example 2)

$$\begin{array}{r}
 6y + x = 11 \\
 + 2y - x = 5 \\
 \hline
 8y = 16 \\
 \hline
 y = 2
 \end{array}$$

$$y = 2$$

$$6(2) + x = 11$$

$$\begin{array}{r}
 12 + x = 11 \\
 -12 \quad \quad \quad -12 \\
 \hline
 x = -1
 \end{array}$$

Elimination Using Subtraction

$$\begin{array}{r} 6x + 11y = -5 \\ - \quad 6x + 9y = -3 \\ \hline \end{array}$$

Careful you are subtracting all of the second
(switch all signs on the second equation)

May want to
change signs and
add

Elimination Using Subtraction

Careful you are subtracting all of the second
(switch all signs on the second equation)

$$\begin{array}{r} 6x + 11y = -5 \\ -(6x + 9y = -3) \\ \hline \end{array}$$

$$\begin{array}{r} + \quad 6x + 11y = -5 \\ \quad -6x - 9y = 3 \\ \hline \end{array}$$

Elimination Using Subtraction

Careful you are subtracting all of the second
(switch all signs on the second equation)

$$\begin{array}{r} 6x + 11y = -5 \\ -6x - 9y = +3 \\ \hline \end{array}$$
$$\frac{2y}{2} = \frac{-2}{2}$$

$$y = -1$$

solve for x

$$6x + 11y = -5$$

$$6x + 11(-1) = -5$$

$$6x - 11 = -5$$

$$6x = -5 + 11$$

$$6x = 6$$

$$x = 1$$

Intersection (1, -1)

Use subtraction to eliminate

$$\begin{array}{r} \text{a) } 7x + 7y = 0 \\ - 7x - y = 24 \\ \hline \end{array}$$

$$\begin{array}{r} \cancel{8y} = -\frac{24}{8} \\ \hline \end{array}$$

$$y = -3$$

$$7x + 7(-3) = 0$$

$$7x - 21 = 0$$

$$\begin{array}{r} 7x = 21 \\ \hline 7 \\ x = 3 \end{array}$$

$$\begin{array}{r} \text{b) } 7x + 6y = -10 \\ - (9x + 6y = -30) \\ \hline \end{array}$$

$$\begin{array}{r} 7x + 6y = -10 \\ + -9x - 6y = 30 \\ \hline \end{array}$$

$$\begin{array}{r} -2x = 20 \\ \hline -2 \quad -2 \end{array}$$

$$x = -10$$

$$7(-10) + 6y = -10$$

$$-70 + 6y = -10$$

$$\begin{array}{r} 6y = 60 \\ \hline 6 \\ y = 10 \end{array}$$
